RULEBOOK
SCHOOL CATEGORY

DEPARTMENT OF ELECTRICAL & ELECTRONIC ENGINEERING
UNIVERSITY OF PERADENIYA

1. INTRODUCTION

1.1 ABOUT PERABOTS 2026

PeraBots 2026 is the flagship annual robotics competition organized by the Electrical and Electronic Engineering Society (EEES), Department of Electrical and Electronic Engineering, University of Peradeniya, in collaboration with the Robotics Society of the University of Peradeniya. The competition aims to promote innovation, creativity, and practical engineering skills by providing participants with an opportunity to design, program, and develop autonomous robotic systems.

PeraBots 2026 features separate School and University categories, enabling participants of different experience levels to engage in robotics challenges appropriate to their academic background. Through a combination of simulation-based activities, practical implementation, and technical learning opportunities, the competition seeks to inspire the next generation of engineers, innovators, and technology enthusiasts while fostering collaboration among educational institutions across Sri Lanka.

1.2 SCHOOL CATEGORY OVERVIEW

The PeraBots 2026 School Category is designed to introduce students to the fundamentals of autonomous robotics through a progressive, hands-on learning experience. Participants will develop the skills required to design, program, and implement autonomous robotic systems capable of sensing their surroundings, making decisions, and completing assigned tasks. The competition combines virtual simulation with practical hardware implementation, encouraging students to transform theoretical concepts into real-world engineering solutions while fostering creativity, teamwork, and problem-solving abilities.

1.3 COMPETITION OBJECTIVES

The competition consists of two phases:

Phase 1 – Online Simulation Round: This phase will be conducted online using the Open Roberta simulation platform, where all teams will program a common virtual robot to complete a series of autonomous challenges involving sensing, navigation, and decision-making. Teams will submit their simulation files for evaluation, and the highest-performing teams will qualify for the final round.

Phase 2 – Physical Final Round: Qualified teams will develop and operate a physical robot and compete at the University of Peradeniya. The final round will evaluate the teams' ability to successfully implement and demonstrate the concepts developed during the simulation phase in a real-world competition environment.

Detailed task descriptions, technical specifications, and evaluation criteria for both phases are provided in the subsequent sections of this rulebook.

1.4 IMPORTANT DATES

- Registration Closes
  September 22
- Phase 1 Begins (Opening Ceremony – Online)
  September 26
- Workshop Series (Online)
  September 28 – October 12
- Phase 1 Submission Deadline
  October 28
- Finalists Announced
  November 5
- Phase 2 - Grand Finale & Closing Ceremony – Physical
  December 12

2. GENERAL COMPETITION INFORMATION

2.1 ELIGIBILITY

- The School Category is open to students in **Grades 6–13** from government, government-approved, private, and international schools across Sri Lanka.
- Students who have completed the G.C.E. Advanced Level Examination but have **not yet enrolled in a university or higher education institute** are also eligible to participate.
- Each participant may represent **only one team** throughout the competition.

2.2 TEAM COMPOSITION

- Each team shall consist of **3 to 5 members**.
- All team members must register under a single school.
- A school may register **multiple teams** under its name.
- Each team shall nominate **one Team Leader**, who will serve as the primary contact for all competition-related communication.
- Each team shall be supervised by a **Teacher-in-Charge**, whose details must be provided during registration.
- Each team may submit **only one robot** for the competition

2.3 REGISTRATION PROCEDURE

- Teams must register through the **official Google Registration Form** before the registration deadline.
- All required information must be completed accurately during the registration process.
- Teams are encouraged to upload a scanned copy of the Principal's confirmation letter during registration if available. The original signed letter must be submitted during the final round by qualified teams.
- Once the registration period has ended, **changes to team members will not be permitted** under any circumstances.
- Participant names submitted during registration will be used for all official documentation, including certificates. Therefore, teams are responsible for ensuring that all information provided is accurate.

The organizing committee reserves the right to verify the eligibility of any participant or team at any stage of the competition. Failure to provide valid supporting documents upon request may result in disqualification.

2.4 OFFICIAL COMMUNICATION

- Upon successful registration, the Team Leader will receive links to the official **PeraBots 2026 WhatsApp Community** and **WhatsApp Announcement Channel.**
- The Team Leader is required to join both platforms and ensure that all team members and the Teacher-in-Charge are added to the WhatsApp Community or provided with the invitation link.
- **All official announcements, updates, notices, schedule changes, and competition-related communications will be disseminated through these official WhatsApp platforms.**
- Teams are responsible for regularly checking these platforms and remaining informed of all announcements issued by the organizing committee.

2.5 CODE OF CONDUCT

- Participants are expected to maintain professionalism, honesty, and respectful behavior throughout the competition.
- Teams shall comply with all competition rules, deadlines, and instructions issued by the organizing committee.
- Any attempt to gain an unfair advantage, provide false information, or engage in misconduct may result in disqualification.
- The decisions of the organizing committee and judging panel shall be considered final in all competition matters.

3. COMPETITION FORMAT

3.1 COMPETITION FLOW

The School Category of PeraBots 2026 consists of two consecutive phases: an **Online Simulation Round** and a **Physical Final Round**. All registered teams are required to participate in the Online Simulation Round. Teams demonstrating the highest overall performance in this phase will qualify for the Physical Final Round, where they will implement and compete using a physical robot in a real-world competition arena.

3.2 PHASE 1 – ONLINE SIMULATION ROUND

The Online Simulation Round will be conducted using the **Open Roberta Lab** simulation platform. Teams will complete the assigned competition tasks by programming the provided virtual robot within the simulation environment. Upon completion, each team must submit the exported Open Roberta project file together with the corresponding shareable project link through the official submission form before the specified deadline. Further details regarding the competition tasks, submission requirements, and evaluation criteria are provided in the subsequent sections of this rulebook.

3.3 PHASE 2 – PHYSICAL FINAL ROUND

Teams selected from the Online Simulation Round will be invited to participate in the Physical Final Round at the **University of Peradeniya**. Finalists will design, build, and program a physical robot capable of completing the assigned competition tasks in a specially prepared competition arena. Additional rules, technical specifications, and competition procedures applicable to the Final Round are provided in the relevant sections of this rulebook.

3.4 QUALIFICATION FOR THE FINAL ROUND

Following the evaluation of all Phase 1 submissions, **a selected number of teams demonstrating the highest overall performance** will qualify for the Physical Final Round. The list of qualified teams will be officially announced **within one week after the Phase 1 submission deadline** through the official PeraBots 2026 communication platforms.

The organizing committee reserves the right to make the final decision regarding team qualification. The decisions of the judging panel and organizing committee shall be final and binding.

4. PHASE 1 – ONLINE SIMULATION ROUND

4.1 OPEN ROBERTA LAB PLATFORM AND COMPETITION PACKAGE

Phase 1 of the PeraBots 2026 School Category will be conducted using the **Open Roberta Lab simulation platform**. The platform can be accessed through the official website: https://dev.open-roberta.org/

EV3dev

Participants will be provided with a resource package containing the required simulation files and tutorial material needed to set up and program the robot.When configuring the robot in Open Roberta Lab, teams must select the EV3DEV model as the robot type.

For each of the three competition tasks, teams will be provided with the following files:

- **Task map.jpg** – Background map or track image used for the simulation environment.
- **Task.xml** – Robot configuration and project file used in Open Roberta Lab.
- **Task.json** – Positioning file containing the obstacle and colour-patch configurations required for the task.

Teams may follow the provided **Open Roberta Lab Import Tutorial** and use the supplied **Resource ZIP File** to prepare the simulation environments.

REQUIRED ACTIONS FOR TEAMS

Teams must:

- Download and extract the provided resource package.
- Access Open Roberta Lab and select the **EV3DEV** robot model.
- Import the corresponding .xml file for the selected task.
- Upload the required .jpg task-map image.
- Upload the corresponding .json file containing the obstacle and colour-patch positions.
- Develop the required robot program using the Open Roberta visual programming blocks.
- Test and refine the robot behavior for each simulation task.
- Save the completed Open Roberta project.
- Submit the completed .xml project files through the official submission link provided by the organizing committee.

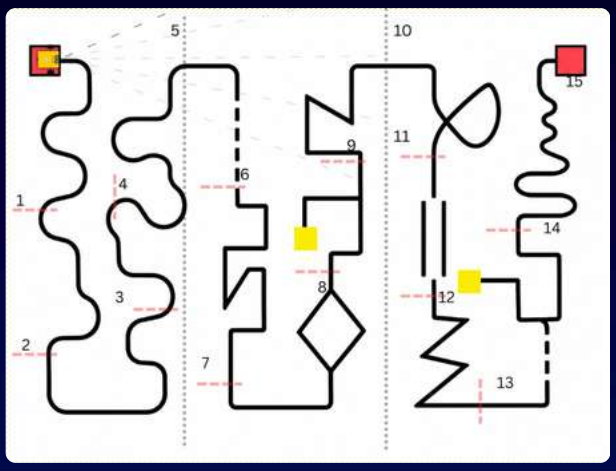

Each simulation task will be evaluated **independently**.

- **Competition Package:** Download from here
- **Import Guide Tutorial:** Play the Tutorial

4.2 COMPETITION TASKS

The Phase 1 challenge consists of three independent simulation tasks. These tasks are designed to evaluate basic autonomous navigation, line following, obstacle detection, colour sensing, and decision-making.

Task 1 – Line Following and Track Navigation

The first simulation task consists of a line-following track divided into **three consecutive difficulty sections:**

- Easy section;
- Moderate section; and
- Hard section.

The track may include:

- Continuous and dashed line segments;
- Sharp turns;
- T-junctions;
- Dead ends; and
- Other changes in track direction.

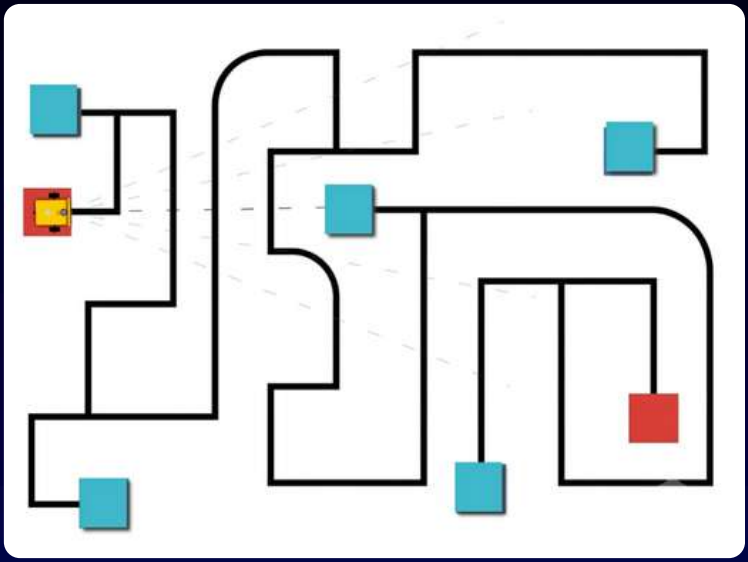

The complete route contains a defined **starting point, two checkpoints, and an end point**.

The **starting and ending points are indicated by red squares**, while the checkpoints are indicated by **dashed markings across the track**.

The robot must autonomously follow the track and progress through the three sections in the correct order.

Evaluation will consider the number of checkpoints successfully reached and the time taken to complete each section.

Task 2 – Obstacle Detection and Route Selection

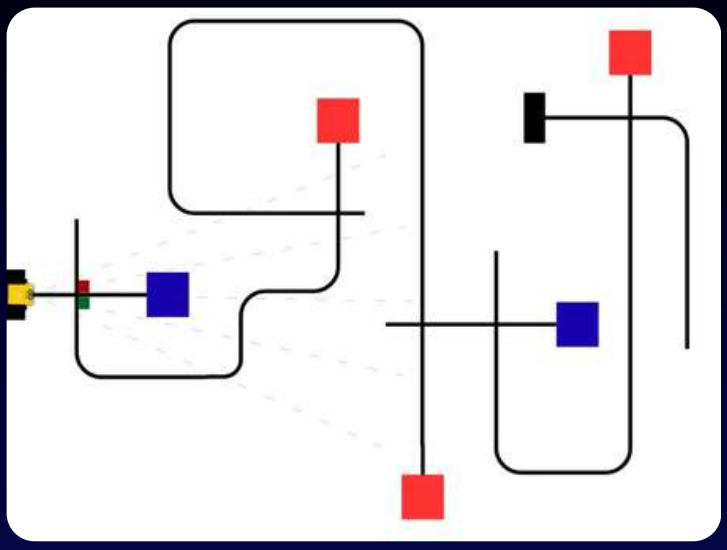

The second simulation task evaluates the robot's ability to detect obstacles and autonomously select a valid route.
The environment will contain several junctions along the track. At selected junctions, one possible route will be blocked by a cube obstacle while another route remains available.
The robot must:

1. Navigate autonomously along the route;
2. Identify when a selected path is blocked;
3. Detect the obstacle before making contact with it;
4. Stop with sufficient clearance;
5. Turn back and return to the most recent junction;
6. Select the alternative route; and
7. Continue navigating until the end of the track is reached.

The challenge will contain **five junction-based route decisions.**

Teams must ensure that the robot maintains sufficient clearance from obstacles before reversing or turning. The robot should not touch an obstacle while approaching, reversing, or performing a turning manoeuvre.
The required clearance should be considered carefully based on the robot's dimensions and turning behaviour.
Evaluation will consider successful navigation through the junctions, obstacle detection, number of collisions, and completion time.

Task 3 – Colour-Based Direction Selection

The third simulation task evaluates the robot's ability to detect colour information and make autonomous navigation decisions.
The route will contain **five decision junctions**. Each junction will be similar to a T-junction, with an additional short forward segment. A coloured square patch will be positioned ahead of each junction.

The square patch will be either red or blue.

At each junction, the robot must identify the colour of the square patch and select the correct direction according to the following rule:

- **Red square patch → Turn left**
- **Blue square patch → Turn right**

The robot may move forward toward the square patch to improve colour detection and then reverse back to the junction before turning. However, this movement is not compulsory.
If the robot is capable of correctly identifying the square patch colour from the junction area, it may directly perform the required turn.

Teams must ensure that sufficient space is maintained before reversing or turning.

Evaluation will consider the number of correct colour-based decisions, successful navigation through the junctions, and completion time.

4.3 ARENA AND SIMULATION ENVIRONMENT

The three simulation environments provided for Phase 1 are intended for **development, testing, and familiarization** before official evaluation.

For Task 1, Task 2, and Task 3, teams will be provided with separate files required to create the corresponding simulation environment in Open Roberta Lab.

For each task, the provided resource package will include:

- A .xml file containing the Open Roberta project and robot configuration;
- A .json file containing the path, obstacle, and colour-patch positions; and
- A .jpg file containing the background map or track image.

Teams must use the provided files to set up the correct simulation environment for each task.

The .json and .jpg files define the official task environment and must not be edited, replaced, or modified by participants.

During official evaluation, the organizing committee may introduce limited changes to the simulation environments while keeping the same fundamental task conditions described in this rulebook.

Such changes may include:

- Different obstacle positions or arrangements;
- Minor changes to route layouts;
- Different red and blue cube arrangements; and
- Similar variations intended to prevent route memorization or hard-coded solutions.

The same official evaluation configuration will be used for all participating teams for each task to ensure fairness.

Teams are therefore expected to develop **general autonomous solutions based on sensing, navigation, and decision-making**, rather than solutions that depend on fixed positions or memorized routes.

Once the programming and permitted robot configuration are complete, teams are required to submit only the finalized .xml file for each task.

4.4 ROBOT CONFIGURATION AND TECHNICAL REQUIREMENTS

The following requirements apply to the robot configuration used for all Phase 1 simulation tasks:

- **Robot Model:** Teams must select and use the **EV3DEV** robot model in Open Roberta Lab. Changing to another robot model is not permitted.
- **Provided Configuration:** The robot configuration included in the official .xml files must be used as the base configuration for each task.
- **Sensor Selection:** Teams may select and configure the sensors required for their solution using the available sensor ports of the EV3DEV robot model.
- **Sensor Limit:** The EV3DEV robot model supports a maximum of four sensor connections, and teams may freely choose the combination of supported sensors required for each task within this limit.
- **Sensor Placement:** Teams may configure the available sensor ports and select suitable sensors according to the requirements of their program and task.

The following basic robot parameters and drive settings provided in the official configuration must **remain unchanged:**

- Wheel diameter;
- Track width;
- Main drive motor assignments;
- Motor regulation settings;
- Motor direction of rotation;
- Left and right motor-side assignments; and
- Other basic mechanical and drive configuration parameters included in the provided robot setup.

Teams are encouraged to focus on sensor selection, programming logic, and autonomous decision-making rather than modifying the basic robot structure.

The robot must operate fully autonomously during official evaluation. Manual control, external commands, or participant intervention will not be permitted once an evaluation attempt begins. Teams must not rely on hard-coded knowledge of the official evaluation layout, as limited variations may be introduced during evaluation.

When approaching obstacles, reversing, or performing turning manoeuvres, teams must ensure that the robot maintains sufficient clearance. Any contact with an obstacle or cube will be recorded as a collision where applicable.

The organizing committee reserves the right to inspect submitted .xml files, robot configurations, and programs to verify compliance with the competition rules, including confirmation that the required robot model and fixed configuration parameters have not been altered.

4.5 SUBMISSION REQUIREMENTS

Each team must submit its completed Open Roberta solution for all three Phase 1 simulation tasks through the official submission method specified by the organizing committee.

Submission Package

Teams are required to submit one ZIP file containing the finalized .xml file for each of the three tasks.
The ZIP file must be named using the following format:

TeamName_Submission.zip

The ZIP file must contain exactly the following three .xml files:

- Task1.xml
- Task2.xml
- Task3.xml

Each .xml file must contain the team's completed robot program together with any permitted sensor-configuration adjustments for the corresponding task.

Teams must not rename the three task files using their team name or any other custom naming format.

The .json files containing the obstacle and colour-patch positions and the .jpg files containing the task maps must not be submitted, as these files must remain unchanged from the original competition package.

Submitted File Requirements

Each submitted .xml file must:

- Open correctly in the required Open Roberta Lab environment when used with the official .json and .jpg files;
- Contain the team's completed robot program;
- Contain only the robot-configuration changes permitted under Section 4.4;
- Use the required EV3DEV robot model;
- Execute correctly without requiring modification by the evaluation team; and
- Correspond to the correct competition task.

Teams are responsible for ensuring that the submitted ZIP file contains all three required .xml files and that each file is complete and functional before the submission deadline.

Submissions with missing files, incorrect file names, or files that cannot be loaded correctly may not be manually corrected by the evaluation team.

Detailed submission instructions and the official submission link will be communicated through the PeraBots 2026 official communication platforms.

4.6 EVALUATION CRITERIA

All submitted simulation projects will be evaluated by the PeraBots 2026 evaluation team.

The evaluation team will run each submitted solution using the official evaluation environment. Participants will not control the robot during evaluation.

Task 1 – Line Following and Track Navigation

The line-following task will be evaluated using a maximum of **five attempts.**

The track consists of three consecutive sections separated by checkpoints. Once a robot successfully reaches a checkpoint, that completed section will be considered achieved.

If the robot fails after reaching a checkpoint, the next evaluation attempt may begin from that checkpoint rather than from the original starting point.

For example, if the robot successfully completes the Easy section and reaches the first checkpoint but fails within the Moderate section, the following attempt may begin from the first checkpoint.

Evaluation will consider:

- Number of checkpoints successfully reached
- Number of track sections successfully completed
- Time taken to complete each section
- Successful completion of the entire track

If the robot fails to reach the first checkpoint within all five attempts, no checkpoint-completion marks will be awarded.

Task 2 – Obstacle Detection and Route Selection

The obstacle-navigation task will be evaluated using three attempts.

Evaluation will consider:

- Number of junctions successfully completed
- Correct detection of blocked paths
- Successful return to the most recent junction
- Correct selection of an alternative path
- Successful arrival at the end of the route
- Completion time
- Number of collisions

The robot is expected to detect obstacles before making contact. Touching an obstacle or cube while approaching, reversing, or turning will be recorded as a collision.

Task 3 – Colour-Based Direction Selection

The colour-based navigation task will be evaluated using **three attempts.**

Evaluation will consider:

- Number of coloured cubes correctly identified
- Number of correct left/right decisions
- Number of junctions successfully completed
- Successful arrival at the end of the route
- Completion time

Performance across the available attempts will be considered using the official evaluation scheme. The best attempt, average performance, and consistency across attempts may contribute with different weightings to the final Phase 1 score.

Attempt Termination

An evaluation attempt may be terminated under either of the following conditions:

- The robot becomes stuck, repeatedly performs an ineffective action, enters a continuous loop, or otherwise makes **no meaningful progress for 15 consecutive seconds** or
- The robot's **entire body remains completely outside the defined track area for more than 2 consecutive seconds.**

A terminated attempt will be recorded as an unsuccessful attempt.

4.7 TIE-BREAKING CRITERIA

In the event that two or more teams obtain the same overall Phase 1 score, the ranking will be determined using the following criteria, in order:

1. Higher overall task-completion performance;
2. Greater number of successfully completed checkpoints and junction decisions;
3. Lower total completion time;
4. Fewer recorded collisions; and
5. Greater consistency across evaluation attempts.

If a tie remains after applying the above criteria, the final decision will be made by the PeraBots 2026 evaluation panel.

5. PHASE 2 – PHYSICAL FINAL ROUND

5.1 COMPETITION VENUE

The Physical Final Round of the PeraBots 2026 School Category will be conducted **at the University of Peradeniya.**

Teams selected based on their performance in Phase 1 will be invited to participate in the Final Round with their fully developed physical robots.

Details regarding the competition schedule, reporting time, venue arrangements, and other logistical information will be communicated to qualified teams through the official PeraBots 2026 communication platforms.

5.2 COMPETITION ARENA

The Final Round arena will be designed as a **combined physical challenge based on the skills introduced during Phase 1.**

The challenge may require teams to apply a combination of:

- Line following;
- Navigation through complex track sections;
- Obstacle detection and avoidance;
- Junction handling;
- Colour detection;
- Autonomous route selection; and
- Decision-making based on sensor inputs.

The robot may also be required to **collect or identify information during earlier parts of the arena and use that information as an input to perform an action later in the challenge.**

The exact arena layout, task sequence, environmental conditions, and final actions will not be disclosed in advance.

Detailed specifications of the Final Round arena will be provided in the **Final Round Challenge Guide.**

5.3 ROBOT REQUIREMENTS

The physical robot used in the Final Round must satisfy the following general requirements:

- The maximum overall dimensions of the robot shall be **20 cm × 20 cm × 20 cm.**
- The robot must be capable of operating **fully autonomously** during an official competition run.
- Teams may select suitable sensors, motors, controllers, processing units, and other electronic or mechanical components required for their robot.
- The robot should be capable of performing the sensing, navigation, and decision-making functions introduced during Phase 1.
- The robot must not intentionally damage, alter, mark, or displace any part of the competition arena.
- The robot must not contain mechanisms, components, or materials that may create an unreasonable safety risk to participants, officials, competition equipment, or the surrounding environment.
- Wireless or external control of the robot during an official run will not be permitted unless specifically allowed by the Final Round rules.
- The robot must comply with any additional technical and safety requirements specified in the Final Round Challenge Guide.

The organizing committee reserves the right to inspect any robot before an official run to verify compliance with the competition requirements.

5.4 COMPETITION PROCEDURE

Qualified teams must bring their completed physical robots to the University of Peradeniya and participate according to the schedule and instructions provided by the organizing committee.

The Final Round will require teams to apply a **combination of the skills developed during Phase 1** in a physical competition environment.

Robots will be required to progress through the arena autonomously and complete the assigned tasks without participant intervention.

During the challenge, the robot may be required to **sense, store, and process information obtained in one part of the arena and use that information to make a later decision or perform a required action.**

Once an official run has started, participants shall not manually control, touch, reposition, or otherwise assist the robot unless instructed or permitted by a competition official.

The detailed competition procedure, including the complete challenge description, arena configuration, task sequence, starting and completion conditions, number of attempts, and other operational requirements, will be specified in the **Final Round Challenge Guide.**

5.5 EVALUATION CRITERIA

Performance in the Final Round will be evaluated based on the robot's ability to autonomously and successfully complete the assigned physical challenge.

Evaluation may consider the following factors:

- Successful completion of individual tasks and the overall challenge
- Autonomous navigation and line following
- Correct obstacle detection and avoidance
- Accurate colour detection and interpretation
- Correct junction and route-selection decisions
- Ability to use information obtained earlier in the challenge for later decisions
- Completion time and navigation efficiency
- Number of collisions or navigation errors
- Successful execution of the required final action

The detailed scoring system, marking distribution, and evaluation procedure will be provided in the **Final Round Challenge Guide.**

5.6 PENALTIES

Penalties may be applied for violations of the competition rules or specified operating procedures. These may include:

- Unauthorized manual intervention during an official run
- Improper interaction with or damage to arena elements
- Failure to follow the specified starting or competition procedure
- Violation of robot dimensional or technical requirements
- Use of prohibited external control or communication
- Any action that provides an unfair advantage over other teams

Serious safety violations, intentional damage to competition equipment, or deliberate violations of competition rules may result in termination of an attempt or disqualification.

The detailed penalty structure applicable to the Final Round will be provided in the **Final Round Challenge Guide**

5.7 TIE-BREAKING PROCEDURE

In the event of a tie between two or more finalist teams, the final ranking will be determined according to the tie-breaking criteria specified for the Final Round.

The tie-breaking procedure may consider factors such as:

- Overall task completion
- Completion time
- Navigation efficiency
- Number of collisions or errors
- Performance in the final task or decision stage

The complete tie-breaking procedure will be specified in the **Final Round Challenge Guide**. Decisions made by the official judging panel regarding the Final Round results shall be final.

Final Round Challenge Guide

The complete Final Round challenge will **not be disclosed in this rulebook.**

A separate **Final Round Challenge Guide** containing the detailed challenge description, arena configuration, task sequence, scoring scheme, penalties, and specific competition procedures will be revealed to qualified teams during the **Opening Ceremony of the Final Round.**

Teams are therefore encouraged to develop adaptable physical robots capable of combining the sensing, navigation, obstacle detection, colour recognition, and decision-making skills introduced during Phase 1.

6. AWARDS & RECOGNITION

6.1 AWARDS

The top-performing teams in the PeraBots 2026 University Category will be recognized based on their Final Round performance.

The following awards will be presented:

- **Champions**
- **1st Runner-up**
- **2nd Runner-up**

The winning teams will receive **cash prizes and medals** in recognition of their achievement.

Details regarding the prize amounts and any additional awards will be announced through the official PeraBots 2026 communication platforms.

6.2 CERTIFICATES

Issue e-certificates for all the participants of Phase 1 (Except the finalist for the final round.) All teams that qualify for and participate in the **Physical Final Round** will receive certificates in recognition of their participation and achievement in PeraBots 2026.

Certificates may also be issued to award-winning teams according to their final placement.

Further information regarding certificate distribution will be communicated through the official competition channels.

7. RULES & REGULATIONS

7.1 GENERAL RULES

- All participants must comply with the instructions provided in this rulebook and by the organizing committee.
- Robots must operate autonomously during official evaluation and competition runs unless otherwise stated.
- Participants must not interfere with the arena, another team, or the evaluation process.
- Teams are responsible for ensuring that their submitted files, software, and physical robots are functional and comply with the specified requirements.
- Any attempt to gain an unfair advantage, manipulate the evaluation environment, or violate the intended competition procedure may result in penalties or disqualification.
- Participants must follow all schedules, deadlines, and instructions communicated through the official PeraBots 2026 platforms.

7.2 SAFETY REQUIREMENTS

All teams must ensure that their robots and associated equipment are safe to operate.

Robots must not contain components, mechanisms, or materials that may cause injury, electrical hazards, fire risks, or damage to the competition arena or surrounding equipment.

The organizing committee reserves the right to inspect any robot and prevent it from participating if it is considered unsafe.

7.3 DISQUALIFICATION CONDITIONS

A team may be disqualified for serious violations including:

- Intentional damage to the competition arena or equipment
- Use of prohibited manual or external control during an official run
- Submission of false participant information or violation of eligibility requirements
- Deliberate manipulation of the evaluation process
- Repeated failure to follow instructions given by competition officials or
- Any form of misconduct that significantly affects the fairness or safety of the competition

The organizing committee may issue warnings or penalties for minor violations before considering disqualification.

7.4 Judges' Decisions

All evaluations, penalties, rankings, and competition results will be determined by the officially appointed evaluation and judging panels.
The decisions of the judges and the organizing committee regarding competition results, rule interpretation, and disputes shall be **final**.
